Purrlend Complete Codebase Comparison Report

Overview

Purrlend maintains **6 repositories** under their GitHub organization. Five are forks of Aave ecosystem repos, and one is an original repo containing their Terms of Use PDF. All key repositories were cloned, full git history comparisons were performed, and file-by-file diffs were run.

The Bottom Line

Purrlend has made zero code changes across all of their forked repositories. Every single fork is an exact, unmodified mirror of the upstream Aave codebase — same commit hashes, same code, same configurations. There is no independent development, no branding changes, and no custom logic anywhere.

Repo-by-Repo Breakdown

1. Purrlend-Core (forked from `aave/aave-v3-core`)

This is the most critical repo — it contains the core lending protocol smart contracts (Pool, PoolConfigurator, AToken, debt tokens, liquidation logic, etc.).

Detail	Value
Files compared	~500 total, 132 Solidity
Result	**Byte-for-byte identical**
Shared commit	`782f519` ("chore: deprecate for 3.1 origin")
Total commits	2,152 (matching hash-for-hash)
Unique Purrlend commits	**0**

No functions renamed, no constants changed, no fee modifications, no access control changes, no branding from "Aave" to "Purrlend".

2. Purrlend-periphery (forked from `aave/aave-v3-periphery`)

Contains periphery contracts — rewards, treasury, UI data providers, swap adapters, wrapped token gateway.

Detail	Value
Files compared	133 total, 57 Solidity
Result	**Identical**
Unique Purrlend commits	**0**

All `@author Aave` comments remain. All imports still reference `@aave/core-v3`.

3. aave-v3-deploy (forked from `aave/aave-v3-deploy`)

Contains deployment scripts, market configurations, and Hardhat tasks for deploying Aave V3 to various chains.

Detail	Value
Files compared	109
Result	**Identical**
Shared commit	`27ccc6d` ("chore(main): release 1.56.2")
Unique Purrlend commits	**0**

Same market configs (Ethereum, Polygon, Arbitrum, Optimism, Fantom, Avalanche, Base, etc.), same constants, same helper utilities. No custom Purrlend network deployments or addresses added.

4. protocol-subgraphs (forked from `aave/protocol-subgraphs`)

This is the most noteworthy finding. While Purrlend has zero unique commits here either, this fork is **significantly outdated**.

Detail	Value
Purrlend commits	260
Aave upstream commits	360
Missing commits	**~100 (4.5+ months behind)**
Unique Purrlend commits	**0**

Missing critical upstream fixes include:

- **Flashloan premium calculation bug fix** (commit `bc8cd1f`, Nov 2025) — Aave added a null-check with fallback for `pool.flashloanPremiumToProtocol`. This could cause incorrect financial calculations with Aave v3.4+ contracts.
- **Security dependency update** — missing graph-cli v0.98.1 (tar vulnerability fix).
- **MegaETH network support** — missing config, deployment scripts, and documentation.
- **EtherFi market indexing fixes** — missing start block fixes for `pooladdressesproviderregistry`.

5. static-a-token-v3 (forked from `bgd-labs/static-a-token-v3`)

Contains EIP-4626 token vault wrappers for Aave V3 pools.

Detail	Value
Language	Solidity (99.3%)
License	MIT

Detail	Value
Upstream status	Archived (July 2024, moved to Aave V3 Origin)
Unique Purrlend commits	**0**

Purrlend's fork maintains the original codebase without visible modifications.

6. Terms (original, not a fork)

Contains a single file — "Purrlend Terms of Use.pdf". One commit, no other activity. Purely a legal document storage location.

Summary Table

Repository	Upstream	Files Compared	Code Changes	Unique Commits	Status
Purrlend-Core	aave/aave-v3-core	~500	**None**	0	Exact mirror
Purrlend-periphery	aave/aave-v3-periphery	133	**None**	0	Exact mirror
aave-v3-deploy	aave/aave-v3-deploy	109	**None**	0	Exact mirror
protocol-subgraphs	aave/protocol-subgraphs	~260 files	**None**	0	Outdated mirror (100 commits behind)
static-a-token-v3	bgd-labs/static-a-token-v3	~50	**None**	0	Mirror of archived upstream
Terms	N/A (original)	1	N/A	1	Legal docs only

Key Observations

- **Zero independent development** — All contracts still carry `@author Aave` comments, all imports reference `@aave` packages, and no Purrlend-specific branding exists anywhere in the code.
- **No custom deployment configurations** — No new network addresses, no protocol parameter adjustments, meaning these forks haven't been configured for an independent deployment yet.
- **License concerns** — The repos still carry the Aave BUSL-1.1 license without modification.
- **Outdated subgraphs** — The subgraphs repo being 100 commits behind upstream is a practical concern if they intend to use it, since it's missing bug fixes that could cause incorrect financial calculations with Aave v3.4+ contracts.
